

Welcome to Litmod

Build Model
Load Model
Help!

Tips!

1. Build

- * When entering the properties of the bodies please keep the format in which default values are.
- * To draw bodies you should have a sketch of the profile where you should know where bodies connect.
- * If you want to know more in property editor fields, just hold the cursor in the field a black box will appear with info.

2. Load Model

- * To load a model you should have a litmod.inp and bodies.out file. If you only have litmod.inp then just run LitMod it will produce bodies.out or some file with info of node points just copy that to the bodies.out.

3. Input/output files

- * Put all input files in one folder where you should also have thermodynamic tables from Generator.
- * Output files name are already entered. You can use them to plot some where else (e.g. GMT)
